Firebase Open Data Set

The screenshot shows the Firebase Open Data Sets documentation page. The browser address bar displays `https://www.firebase.com/docs/open-data/`. The page features a top navigation bar with the Firebase logo, links for OVERVIEW, GETTING STARTED, PRICING, and DOCS (which is active), and buttons for LOGIN and SIGN UP. A left sidebar contains a search bar and a list of navigation items: Docs Home, PLATFORMS (Web, iOS, Android, REST), Security & Rules, Hosting, Partnerships, and Open Data Sets. The main content area has a blue header with the text 'FIREBASE Open Data Sets'. Below this, a paragraph states: 'Firebase Open Data Sets are Firebases that we populate with live-updated data from a variety of sources. They are a quick and easy way to get realtime data for your app.' At the bottom, a table lists four data sets: Airport Delays, Cryptocurrencies, Earthquakes, and Parking, each with a brief description.

Data Set	Description
Airport Delays	Get the latest airport delay and status updates in realtime.
Cryptocurrencies	Get the latest USD/BTC and USD/LTC exchange rates in realtime.
Earthquakes	Information on earthquakes anywhere on Earth in realtime.
Parking	Realtime data on the latest street parking price and garage availability for SF.

json-server on GH

The screenshot shows the GitHub repository page for `typicode/json-server`. The browser address bar shows the URL `https://github.com/typicode/json-server`. The repository name `typicode / json-server` is displayed at the top, along with statistics: 29 watchers, 878 stars, and 64 forks. Below this, a description reads: "Get a full fake REST API with zero coding in less than 30 seconds (seriously)".

Repository statistics are shown: 193 commits, 1 branch, 43 releases, and 10 contributors. The current branch is `master`. The version `0.7.0` is highlighted. The latest commit `d9b1eebbff` is attributed to `typicode` and dated "2 days ago".

A table of files and their commit history is displayed:

File	Commit Message	Time
<code>bin</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>src</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>test</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>.gitignore</code>	Fix CLI	2 months ago
<code>.travis.yml</code>	Update travis.yml to Node 0.12	2 months ago
<code>LICENSE</code>	update copyright year	a year ago
<code>README.md</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>package.json</code>	0.7.0	2 days ago

Below the file list, the `README.md` is partially visible, showing the title `JSON Server` and status badges: `build passing` and `npm package 0.7.0`.

On the right sidebar, the `Code` tab is selected, showing options to clone the repository. The HTTPS clone URL is `https://github.com/1`. Below this, there are buttons for `Clone in Desktop` and `Download ZIP`.

Install and Run ...

```
$ npm install -g json-server
```

```
$ json-server -p ./airports.json
```

Our Stub Server

```

JSONPath - XPath for JSON | 2007-02-21 | e1

A frequently emphasized advantage of XML is the availability of plenty tools to analyse, transform and selectively extract data out of XML documents. XPath is one of these powerful tools.

It's time to wonder, if there is a need for something like XPath4JSON and what are the problems it can solve.

- Data may be interactively found and extracted out of JSON structures on the client without special scripting.
- JSON data requested by the client can be reduced to the relevant parts on the server, such minimizing the bandwidth usage of the server response.

If we agree, that a tool for picking parts out of a JSON structure at hand does make sense, some questions come up. How should it do its job? How do JSONPath expressions look like?

Due to the fact, that JSON is a natural representation of data for the C family of programming languages, the chances are high, that the particular language has native syntax elements to access a JSON structure.

The following XPath expression

```
/store/book[1]/title
```

would look like

```
x.store.book[0].title
```

or

```
x['store']['book'][0]['title']
```

in Javascript, Python and PHP with a variable x holding the JSON structure. Here we

Exercise 09

JSONPath Expression Tester

The screenshot shows a web browser window with the title "JSONPath Expression Tester" and the URL "jsonpath.curiousconcept.com". The page has a green header with the "JSONPATH" logo and navigation links: "About", "Learn", "Changelog", and "Contact". The main content area has a green background and contains the following elements:

- JSON Data/URL**: A large white text area for input.
- JSONPath Expression**: A white text area for input.
- JSON Template**: A dropdown menu currently showing "2 Space Tab".
- Implementation**: A dropdown menu currently showing "JSONPath 0.8.3".
- Process**: A green button located at the bottom center.
- Instructions**: On the left, a white curved arrow points to the input fields with the text: "Paste in JSON or a URL, enter the JSONPath and away you go."
- Output**: On the right, a white curved arrow points to the output area.

```

The JSON Query Language

Decades of Lessons Learnt

JSONiq is a query and processing language specifically designed for the popular JSON data model. The main ideas behind JSONiq are based on lessons learnt in more than 30 years of relational query systems and more than 15 years of experience with designing and implementing query languages for semi-structured data.

Complex Processing

A JSONiq program is an expression; the result of the program is the result of the evaluation of the expression. Expressions have fundamental role in the language: every language construct is an expression, and expressions are fully composable. Project, Filter, Join, Group... Like SQL, JSONiq can do all that.

The SQL of NoSQL

JSONiq is an expressive and highly optimizable language to query and update NoSQL stores. It enables developers to leverage the same productive high-level language across a variety of NoSQL products.

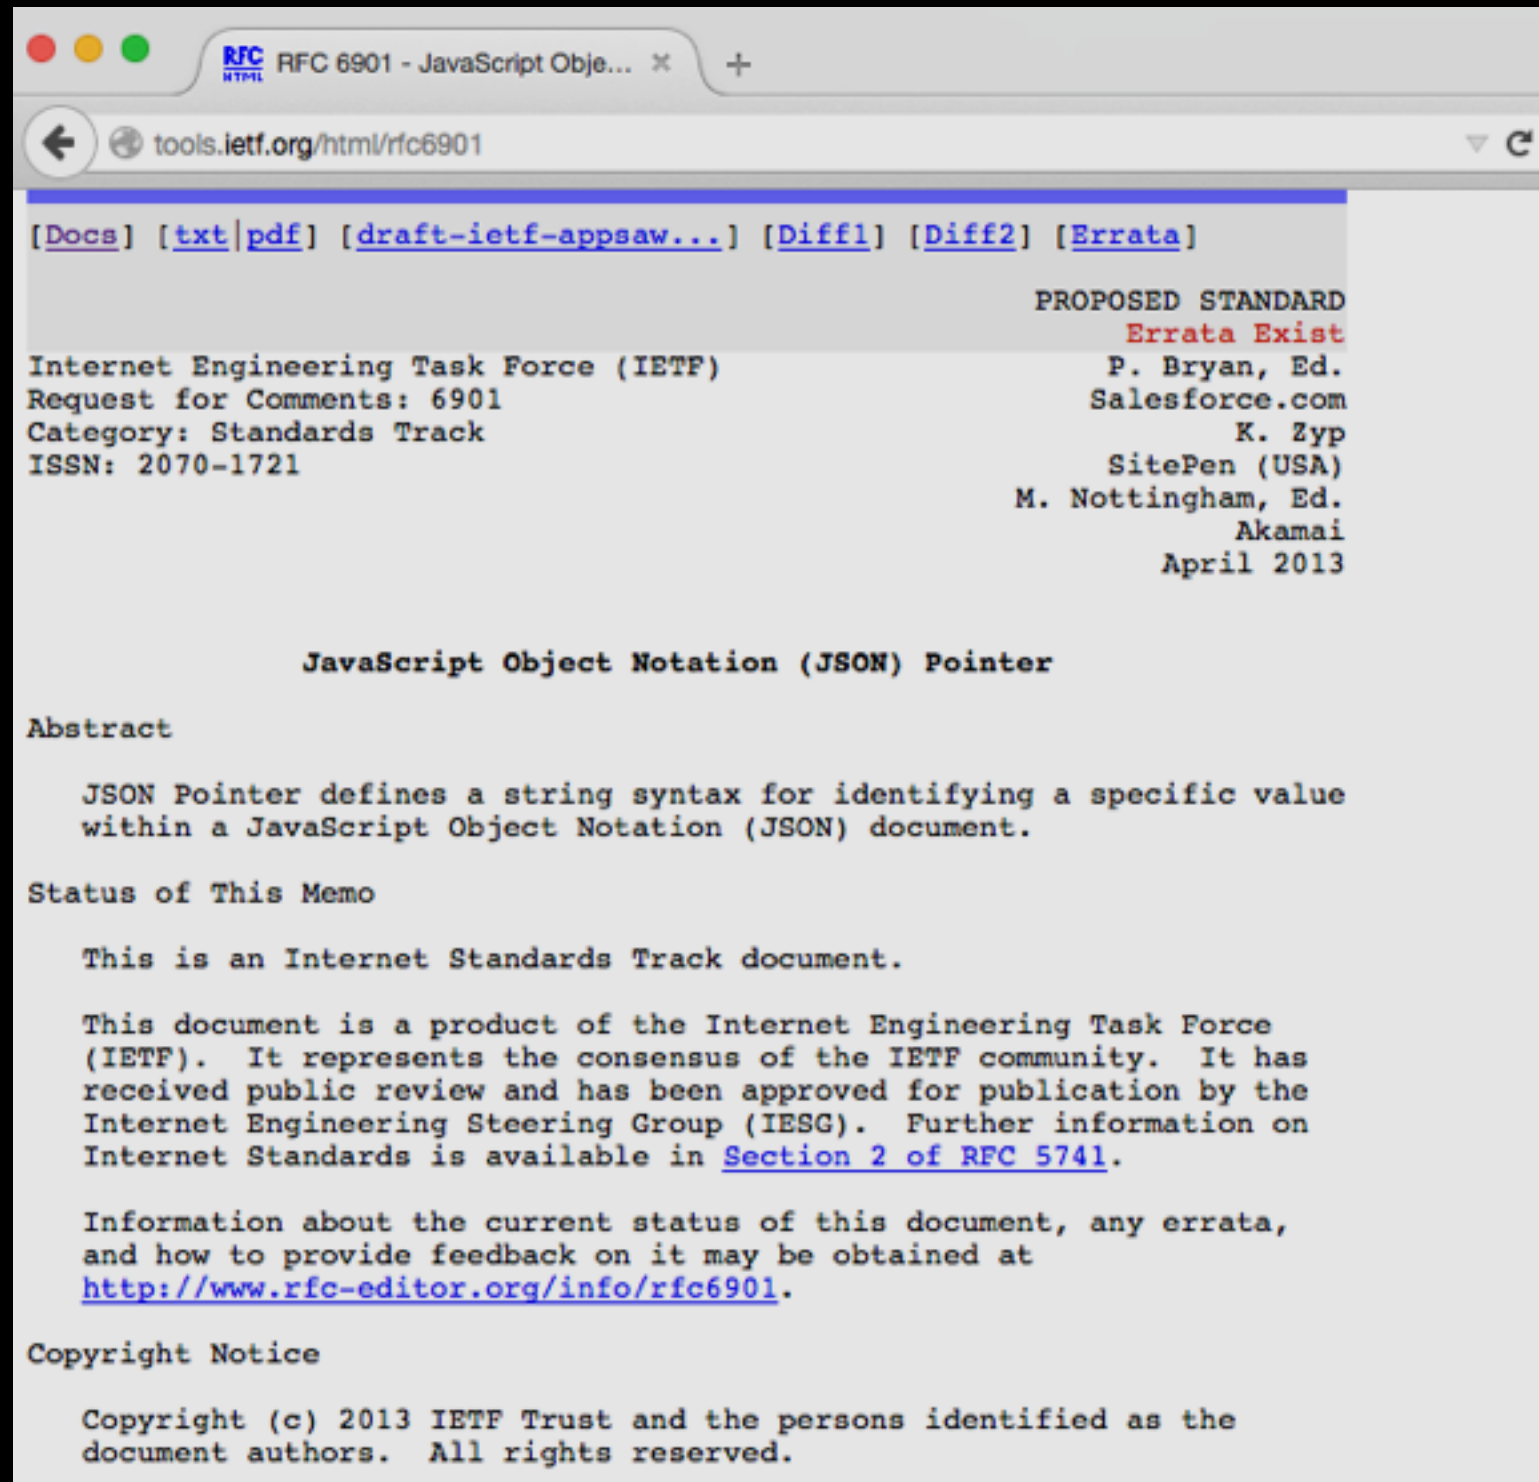

JSONiq Example

```
1
2 42 instance of integer # true
3 42 instance of decimal # true
4 42.6 instance of decimal # true
5 42.6e10 instance of double # true
6 "fred" instance of string # true
7 true instance of boolean # true
8 null instance of null # true
9

JavaScript Object Notation (JSON) Pointer

Abstract

JSON Pointer defines a string syntax for identifying a specific value within a JavaScript Object Notation (JSON) document.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in [Section 2 of RFC 5741](#).

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <http://www.rfc-editor.org/info/rfc6901>.

JSON Query

The screenshot shows a web browser window with the address bar displaying `https://www.sitepen.com/blog/2008/07/16/jsonquery-data-querying-beyond-jsonpath/`. The sitepen logo is in the top left, and navigation links for Services, Blog, About Us, Contact, and Login are in the top right. The main heading of the article is "JSONQuery: Data Querying Beyond JSONPath". A yellow notice box states: "Notice: We recommend reading our newer post on [RQL](#)." The article text describes JSONQuery as a new data querying tool added to Dojo 1.2, intended to succeed and improve upon the JSONPath module. It lists features like filtering, recursive search, sorting, mapping, range selection, and flexible expressions with wildcard string comparisons and various operators. It also mentions that JSONQuery provides safe evaluation with language agnostic expressions, preventing arbitrary code execution, and uses intuitive result-based evaluation for successive query operations. Furthermore, it notes significant performance improvements, with 20-100x faster execution for common filter operations on large arrays compared to JSONPath. The article concludes by stating that JSONQuery generally supersedes the functionality of JSONPath and provides syntax that matches and behaves like JavaScript where the syntax intersects for maximum ease of use. On the right side, there is a section for "Featured articles" listing: "Intern 2.2 released", "Introducing dstore", "On YUI, Dojo 2, and long-term JavaScript toolkits", "Testable code best practices", and "Performance Comparison: dgrid OnDemandGrid and Dojo Grid". A small profile picture of Kris Zyp is shown next to the text "By Kris Zyp July 16, 2008". At the bottom right, there is a button that says "We're hiring!".

JSONQuery: Data Querying Beyond JSONPath

Notice: We recommend reading our newer post on [RQL](#).

A new data querying tool for has been added to [Dojo](#) 1.2. JSONQuery is a new module intended to succeed and improve upon the JSONPath module introduced in Dojo 1.1. JSONQuery provides a comprehensive set of data querying tools including filtering, recursive search, sorting, mapping, range selection, and flexible expressions with wildcard string comparisons and various operators.

JSONQuery provides [safe evaluation with language agnostic expressions](#) that prevents arbitrary code execution. It also uses intuitive [result-based evaluation](#) that allows successive query operations. Furthermore, the new JSONQuery module provides significant performance improvements, with 20-100x faster execution with the common filter operation on large arrays than the JSONPath module. JSONQuery generally supersedes the functionality of JSONPath and provides syntax that matches and behaves like JavaScript where the syntax intersects for maximum ease of use.

Usage API

A JSONQuery can be executed with the following call:

json:select

The screenshot shows a web browser window with the URL `jsonselect.org/#overview`. The page has a dark theme. At the top, the title `json:select()` is displayed in a large, light-colored font, followed by the subtitle *CSS-like selectors for JSON.* Below this, there are navigation links: [Overview](#), [Try It!](#), [Docs](#), [Code](#), [Contact](#), and [Credit](#). A diagonal banner on the right side says "Fork me on GitHub". The main content area contains three paragraphs of text: "JSONSelect is an *experimental* selector language for JSON.", "It makes it easy to access data in complex JSON documents.", and "It *feels like* CSS." Below these is the question "Why not give it a try?". To the right of the text is a code block showing a JSON object and a selector. The JSON object is:

```
{  "author": {    "name": {      "first": "Lloyd",      "last": "Hilael"    },    "drinkPref": [      "whiskey",      "beer",      "wine"    ],    "thing": "JSONSelect site",    "license": "(cc) BY-SA"  }}
```

 The selector `".author .drinkPref :first-child"` is shown above the JSON object, separated by a dashed line. The word "whiskey" in the JSON array is highlighted in yellow.

JSONSelect is an *experimental* selector language for JSON.

It makes it easy to access data in complex JSON documents.

It *feels like* CSS.

Why not give it a try?

```
".author .drinkPref :first-child"
-----
{
  "author": {
    "name": {
      "first": "Lloyd",
      "last": "Hilael"
    },
    "drinkPref": [
      "whiskey",
      "beer",
      "wine"
    ],
    "thing": "JSONSelect site",
    "license": "(cc) BY-SA"
  }
}
```

Jaql is a query language designed for Javascript Object Notation (JSON), a data format that has become popular because of its simplicity and modeling flexibility. Jaql is primarily used to analyze large-scale semi-structured data. Core features include user extensibility and parallelism. In addition to modeling semi-structured data, JSON simplifies extensibility. Hadoop's Map-Reduce is used for parallelism.

You can get started with the [Jaql Overview](#) of the current version, and check out the [RoadMap](#) of future changes.

Announcement: As you may have noticed, development here has been put on hold. The good news is that Jaql is a part of IBM's [BigInsights](#) product (updated [docs](#)) and we are very excited to help solve a very wide range of problems! A free download of [BigInsights](#) is available where you can try out Jaql (and some new features) along with the many other features in the product. It has been a hectic period for us, but we also want to let you know that we intend to and are working towards reviving Jaql's open source development as well. Please stay tuned and thank you for all of the feedback!

jq

The screenshot shows the homepage of the jq project. At the top is a navigation bar with links: jq, Tutorial, Download, Manual, Issues, Source, Try online!, and NEWS. The main content area features a large logo consisting of a dot, a slash, and the letters 'jq'. To the right of the logo, it says 'jq is a lightweight and flexible command-line JSON processor.' Below this text are two buttons: 'Download jq-1.4-2-g15c4a7f-dirty' and 'Try online!'. Further down, there are three columns of text describing the tool's capabilities and ease of use. At the bottom, there is a 'News' section with a single entry dated '06 June 2014'.

jq is a lightweight and flexible command-line JSON processor.

[Download jq-1.4-2-g15c4a7f-dirty](#)

[Try online!](#)

jq is like `sed` for JSON data – you can use it to slice and filter and map and transform structured data with the same ease that `sed`, `awk`, `grep` and friends let you play with text.

jq is written in portable C, and it has zero runtime dependencies. You can download a single binary, `scp` it to a far away machine, and expect it to work.

jq can mangle the data format that you have into the one that you want with very little effort, and the program to do so is often shorter and simpler than you'd expect.

Go read the [tutorial](#) for more, or the [manual](#) for way more.

News

- 06 June 2014
jq 1.4 (finally) released! Get it on the [download](#) page.

jq play

The screenshot shows the jqplay.org website in a web browser. The browser's address bar displays "https://jqplay.org". The website's header includes the "jqplay" logo and the tagline "A playground for jq 1.4".

The main interface is divided into three primary sections:

- Filter:** A text input field at the top left, currently empty.
- JSON:** A large text area below the filter, containing a single line with the number "1".
- Result:** A large text area on the right, also containing a single line with the number "1". Above this area are five checkboxes: "Compact Output", "Null Input", "Raw Input", "Raw Output", and "Slurp", all of which are currently unchecked.

At the bottom of the page is a "Cheatsheet" section. It includes a note: "Click on the icons ([icon]) in the table below to see examples." Below this note is a table with four rows, each showing a jq filter, its description, and a small icon.

<code>.</code>	unchanged input	[icon]	<code>,</code>	feed input into multiple filters	[icon]
<code>.foo, .foo.bar, .foo?</code>	value at key	[icon]	<code> </code>	pipe output of one filter to the next filter	[icon]

jq Examples

```
1
2 In jq-play
3 -----
4 .airports
5
6 .airports[10]
7
8 .airports[10] | { id, IATA, weather }
9
10 .airports[10:15] | .[] | { id, IATA, weather }
11
12
13 In curl
14 -----

Overview

JSON Search

JSON Transform

JSON Transform

JSON-T

The screenshot shows a web browser window with the address bar displaying 'goessner.net/articles/jsont/'. The page title is '<stefan.goessner/> Mechanik, das Web und der ganze Rest'. The navigation bar includes links for 'Home', 'Lehre', 'Download', and 'Info'. The main content area is titled '# Transforming JSON' with a date of '2006-01-30' and a version 'e1'. The text describes JSON as a lightweight text format for data interchange, better suited for structured data than XML. It mentions a frequently requested task is transforming JSON data into other formats like XML or HTML. The most obvious way to achieve this is using a programming language (ECMAScript, Ruby, etc.) and the DOM-API. In XML, documents can be transformed by another XML document containing transformation rules (XSLT) and applying these rules using an XSLT-processor. Adopting that concept, the author has been experimenting with a set of transformation rules (written in JSON). As a result, in analogy to XML/XSLT, the combination JSON/JSONT can be used to transform JSON data into any other format by applying a specific set of rules.

The second section is '# Introducing JSONT' with a date of '2006-01-30' and a version 'e2'. It starts with 'Let's start with a simple JSON object' and shows a JSON object:

```
{ "link": { "uri": "http://company.com", "title": "company homepage" } }
```

 which is to be transformed into an HTML link element:

```
<a href="http://company.com">company homepage</a>
```

 For doing this, a corresponding rule is written:

```
{ "link": "<a href=\"{link.uri}\">{link.title}</a>" }
```

 and using a processor like `jsonT(data, rules)` the rule can be applied to the data.

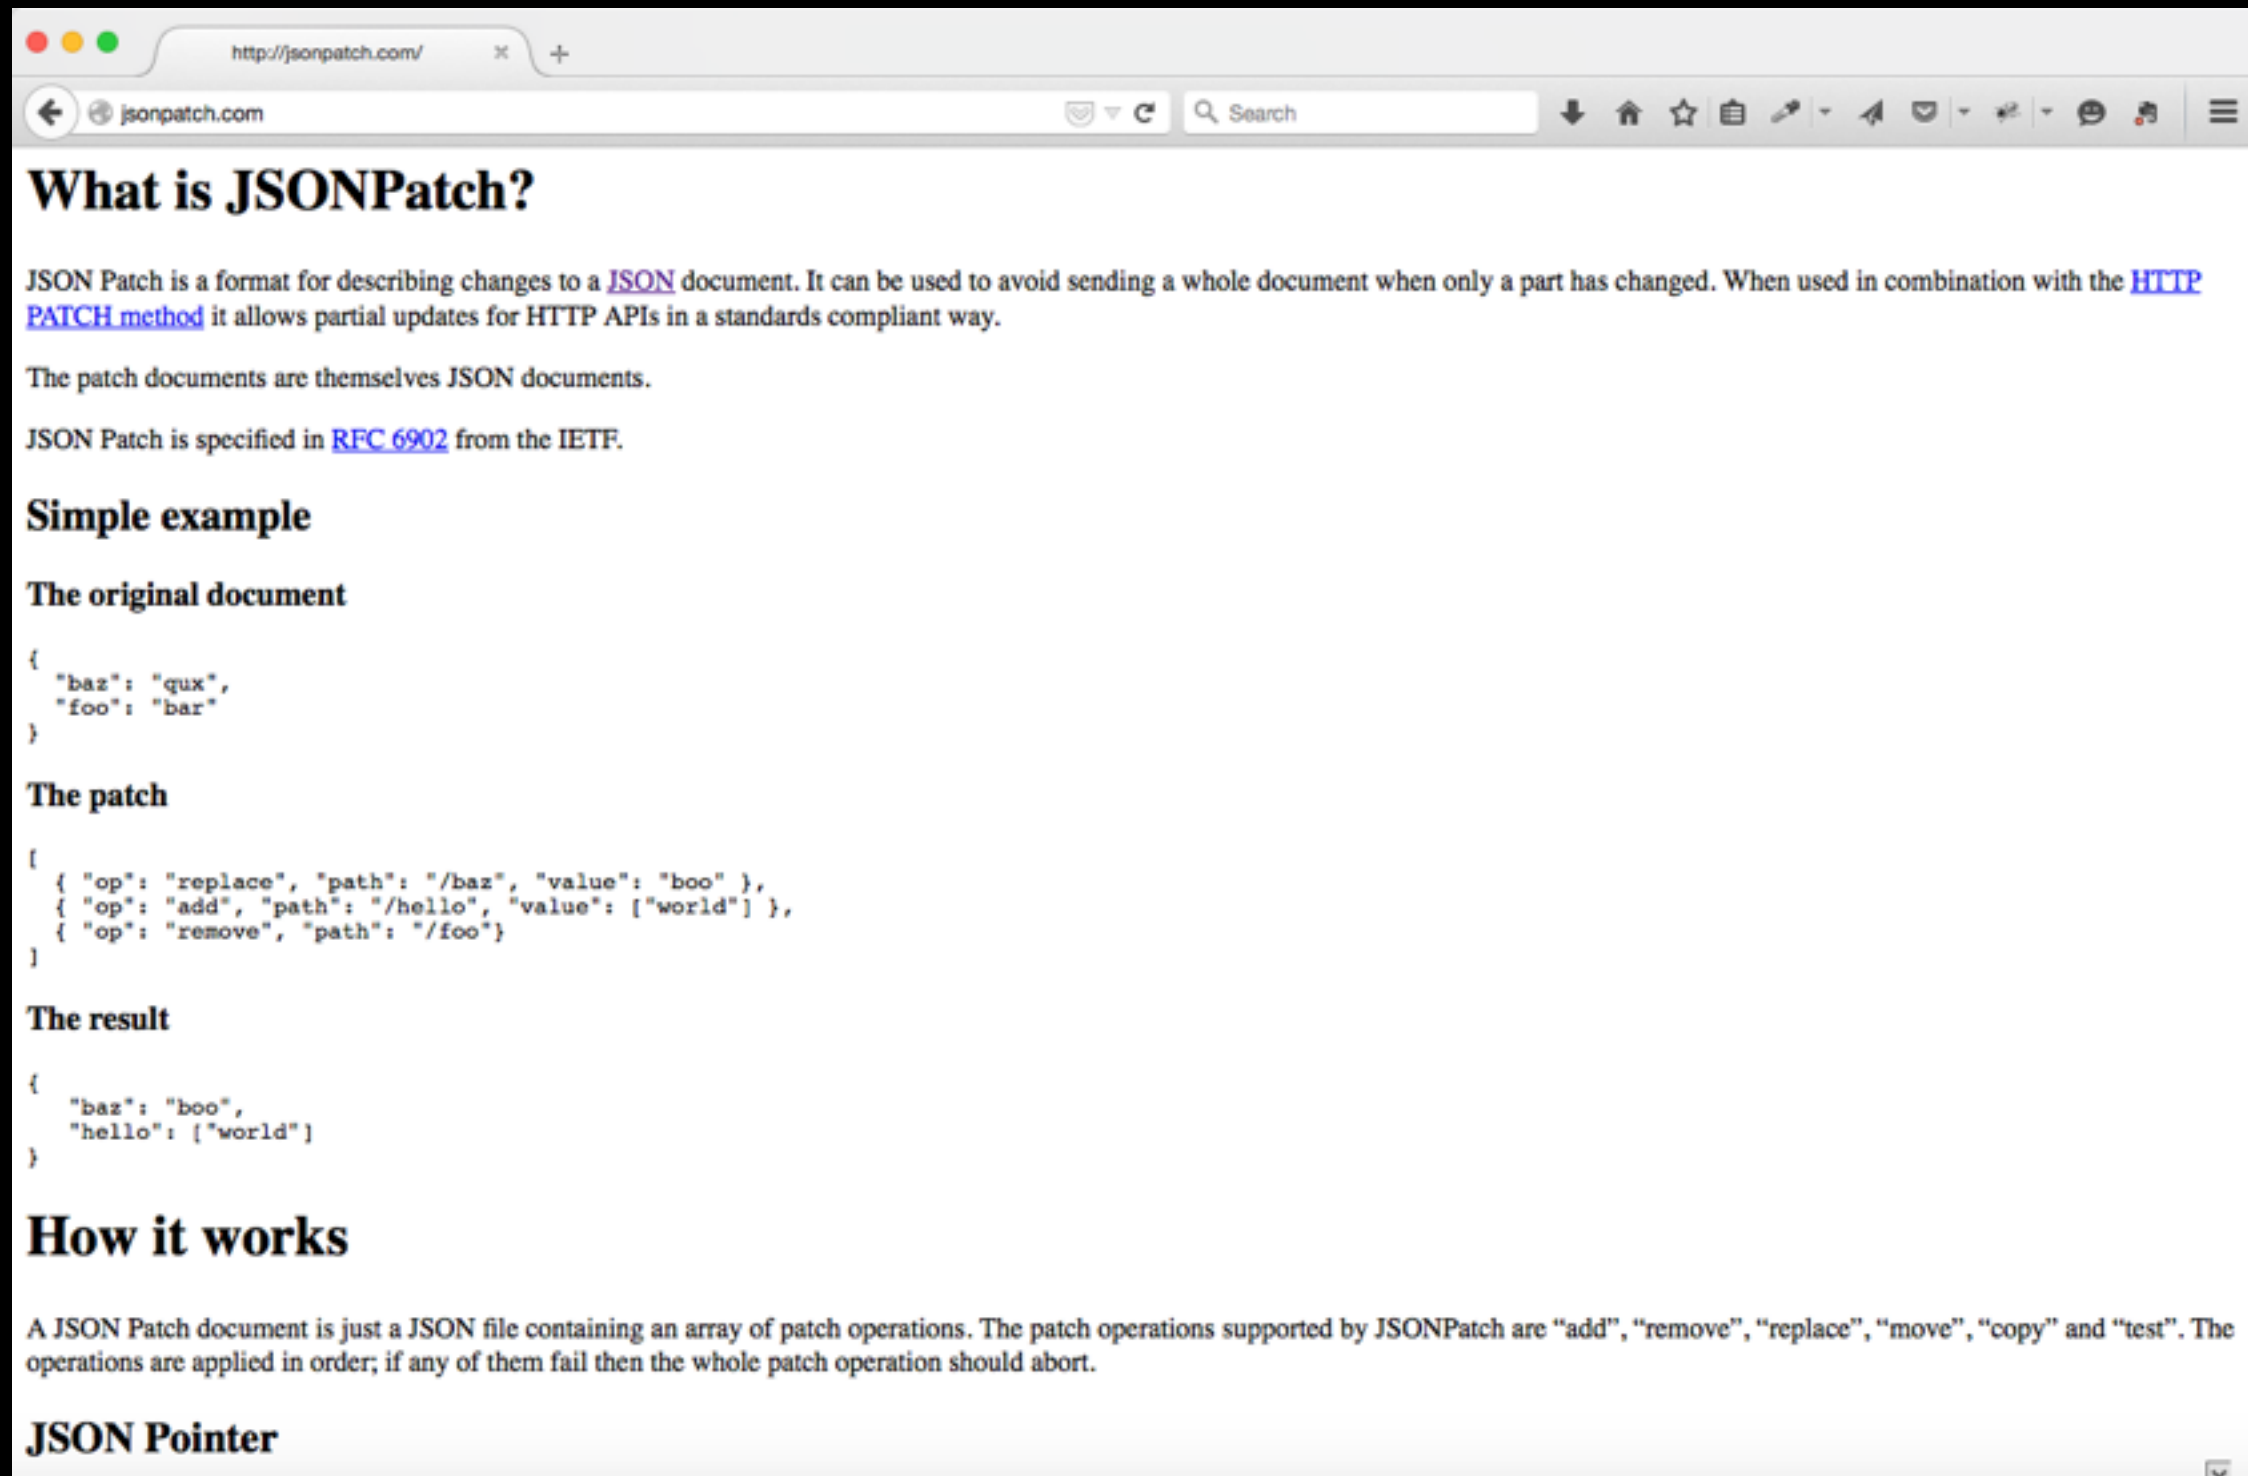

The right sidebar contains a search box with a 'Google Search' button, a table of contents titled '» Inhalt ..' listing 'Home', 'Lehre', 'Dynamik', 'Articles', 'DOM Events', 'Wiky', '2D Vectors', 'Slideous', 'JsonT', 'JSONPath', 'SVG', 'Download', 'Admin', and 'Info', and a '» comments ..' section with 'Exercise 09'.

JSON Patch

A screenshot of a web browser displaying the JSONPatch.com website. The browser's address bar shows 'http://jsonpatch.com/'. The website has a clean, minimalist design with a white background and black text. The main heading is 'What is JSONPatch?'. Below it, there is a paragraph explaining that JSON Patch is a format for describing changes to a JSON document, used in combination with the HTTP PATCH method. It also mentions that patch documents are themselves JSON documents and that the format is specified in RFC 6902. The next section is 'Simple example', which contains three sub-sections: 'The original document', 'The patch', and 'The result', each followed by a JSON code block. The final section is 'How it works', which explains that a JSON Patch document is a JSON file containing an array of patch operations, and lists the supported operations: 'add', 'remove', 'replace', 'move', 'copy', and 'test'. The website also has a 'JSON Pointer' link at the bottom left.

What is JSONPatch?

JSON Patch is a format for describing changes to a [JSON](#) document. It can be used to avoid sending a whole document when only a part has changed. When used in combination with the [HTTP PATCH method](#) it allows partial updates for HTTP APIs in a standards compliant way.

The patch documents are themselves JSON documents.

JSON Patch is specified in [RFC 6902](#) from the IETF.

Simple example

The original document

```
{
  "baz": "qux",
  "foo": "bar"
}
```

The patch

```
[
  { "op": "replace", "path": "/baz", "value": "boo" },
  { "op": "add", "path": "/hello", "value": ["world"] },
  { "op": "remove", "path": "/foo" }
]
```

The result

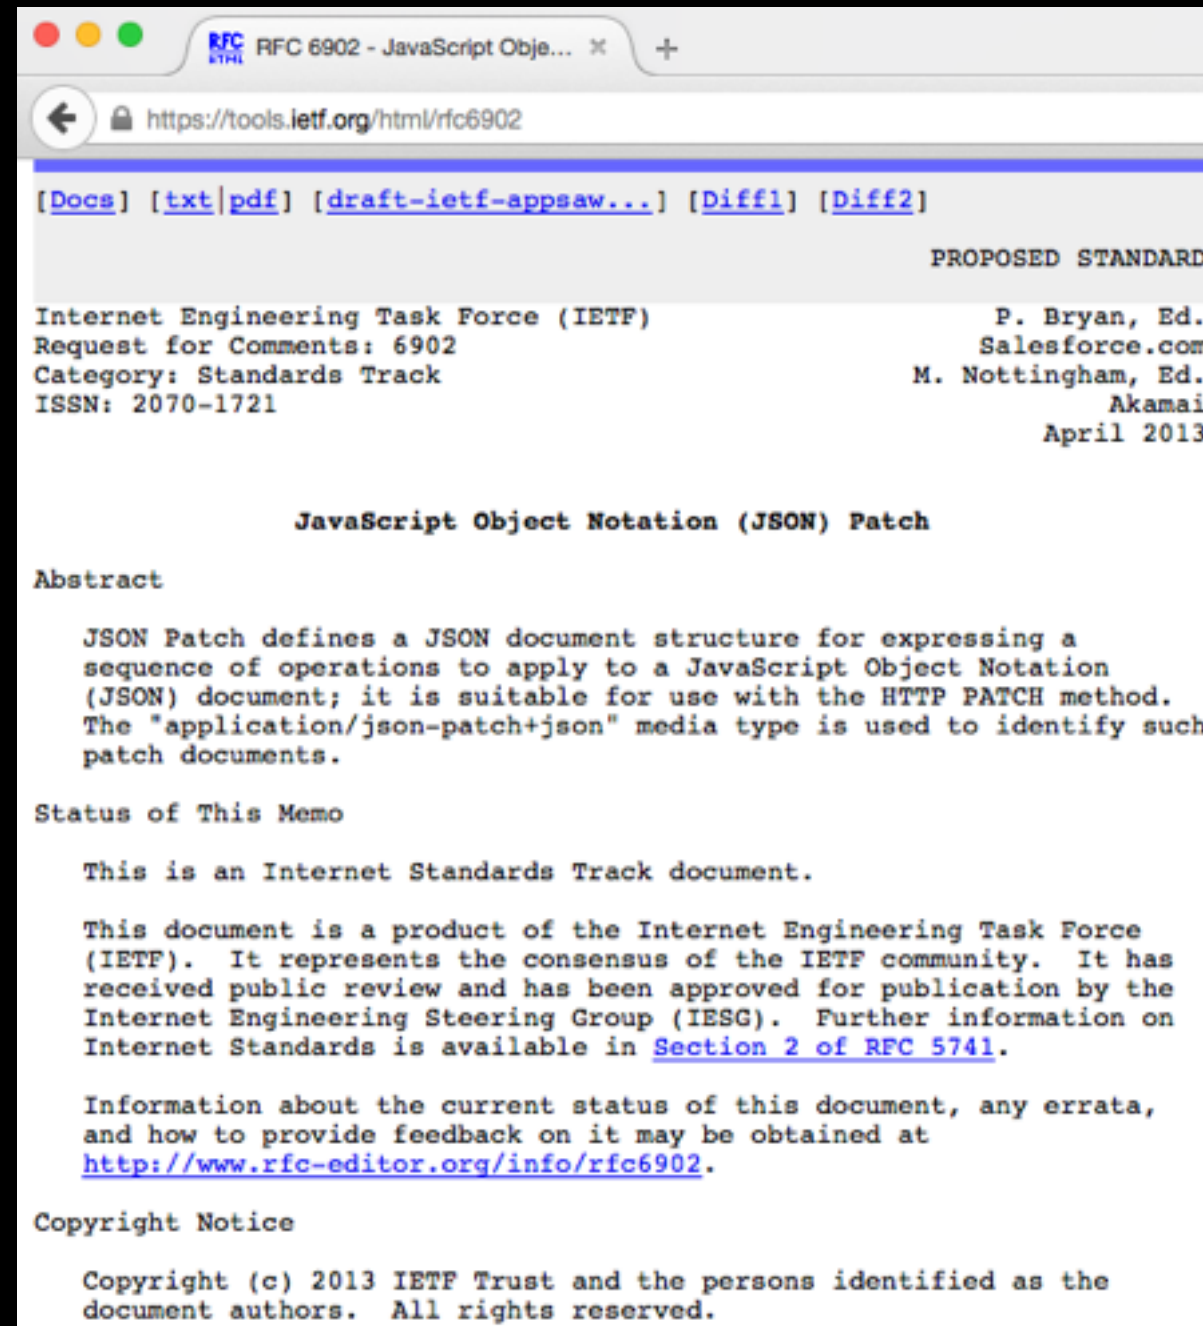

```
{
  "baz": "boo",
  "hello": ["world"]
}
```

How it works

A JSON Patch document is just a JSON file containing an array of patch operations. The patch operations supported by JSONPatch are "add", "remove", "replace", "move", "copy" and "test". The operations are applied in order; if any of them fail then the whole patch operation should abort.

JSON Pointer

JSON Patch Standard

The screenshot shows a web browser window with the title "RFC 6902 - JavaScript Object Notation (JSON) Patch". The address bar shows the URL "https://tools.ietf.org/html/rfc6902". The page content includes navigation links: [Docs], [txt|pdf], [draft-ietf-appsaw...], [Diff1], and [Diff2]. The status is "PROPOSED STANDARD". The authors listed are P. Bryan, Ed. (Salesforce.com) and M. Nottingham, Ed. (Akamai), dated April 2013. The title "JavaScript Object Notation (JSON) Patch" is centered. The "Abstract" section describes the JSON Patch document structure and its use with the HTTP PATCH method. The "Status of This Memo" section states it is an Internet Standards Track document and provides information on public review and feedback. The "Copyright Notice" section states copyright (c) 2013 IETF Trust and the persons identified as the document authors.

JavaScript Object Notation (JSON) Patch

Abstract

JSON Patch defines a JSON document structure for expressing a sequence of operations to apply to a JavaScript Object Notation (JSON) document; it is suitable for use with the HTTP PATCH method. The "application/json-patch+json" media type is used to identify such patch documents.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in [Section 2 of RFC 5741](#).

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <http://www.rfc-editor.org/info/rfc6902>.
