Our Architecture

Firestore Open Data Set

The screenshot shows the Firebase Open Data Sets documentation page. The browser address bar displays `https://www.firebase.com/docs/open-data/`. The page features a top navigation bar with the Firebase logo, links for OVERVIEW, GETTING STARTED, PRICING, and DOCS (which is highlighted), and buttons for LOGIN and SIGN UP. A left sidebar contains a search bar and a list of navigation items: Docs Home, PLATFORMS (Web, iOS, Android, REST), Security & Rules, Hosting, Partnerships, and Open Data Sets (which is selected). Below the Open Data Sets link, a sub-menu lists specific data sets: Airport Delays, Cryptocurrencies, Earthquakes, and Parking. The main content area has a blue header with the text 'FIREBASE Open Data Sets'. Below this, a paragraph explains that these are Firebases populated with live-updated data from various sources. A table at the bottom lists four data sets with their descriptions.

Data Set	Description
Airport Delays	Get the latest airport delay and status updates in realtime.
Cryptocurrencies	Get the latest USD/BTC and USD/LTC exchange rates in realtime.
Earthquakes	Information on earthquakes anywhere on Earth in realtime.
Parking	Realtime data on the latest street parking price and garage availability for SF.

json-server on GH

The screenshot shows the GitHub repository page for `typicode/json-server`. The browser address bar shows the URL `https://github.com/typicode/json-server`. The repository name `typicode / json-server` is displayed at the top, along with statistics: 29 watchers, 878 stars, and 64 forks. Below this, a description reads: "Get a full fake REST API with zero coding in less than 30 seconds (seriously)".

Repository statistics are shown: 193 commits, 1 branch, 43 releases, and 10 contributors. The current branch is `master`, and the repository is named `json-server`.

The commit history for the `0.7.0` tag is displayed, showing a list of files and their commit messages:

File	Commit Message	Time
<code>bin</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>src</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>test</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>.gitignore</code>	Fix CLI	2 months ago
<code>.travis.yml</code>	Update travis.yml to Node 0.12	2 months ago
<code>LICENSE</code>	update copyright year	a year ago
<code>README.md</code>	Allow middlewares to be set before json-server middlewares	2 days ago
<code>package.json</code>	0.7.0	2 days ago

Below the commit history, the `README.md` file is shown. The title is **JSON Server**, and it includes status badges: `build passing` and `npm package 0.7.0`.

On the right side, the `Code` tab is selected, showing options to clone the repository. The `HTTPS clone URL` is `https://github.com/1`. Below this, it says "You can clone with [HTTPS](#), [SSH](#), or [Subversion](#)." There are buttons for `Clone in Desktop` and `Download ZIP`.

Install and Run ...

```
$ npm install -g json-server
```

```
$ json-server -p ./airports.json
```

Our Stub Server

```

JSONPath - XPath for JSON | 2007-02-21 | e1

A frequently emphasized advantage of XML is the availability of plenty tools to analyse, transform and selectively extract data out of XML documents. XPath is one of these powerful tools.

It's time to wonder, if there is a need for something like XPath4JSON and what are the problems it can solve.

- Data may be interactively found and extracted out of JSON structures on the client without special scripting.
- JSON data requested by the client can be reduced to the relevant parts on the server, such minimizing the bandwidth usage of the server response.

If we agree, that a tool for picking parts out of a JSON structure at hand does make sense, some questions come up. How should it do its job? How do JSONPath expressions look like?

Due to the fact, that JSON is a natural representation of data for the C family of programming languages, the chances are high, that the particular language has native syntax elements to access a JSON structure.

The following XPath expression

```
/store/book[1]/title
```

would look like

```
x.store.book[0].title
```

or

```
x['store']['book'][0]['title']
```

in Javascript, Python and PHP with a variable x holding the JSON structure. Here we

Exercise 09

JSONPath Expression Tester

The screenshot shows a web browser window with the title "JSONPath Expression Tester" and the URL "jsonpath.curiousconcept.com". The page has a green header with the "JSONPATH" logo and the words "EXPRESSION" and "TESTER" stacked vertically. Navigation links for "About", "Learn", "Changelog", and "Contact" are on the right. The main content area has a green background. On the left, a white curved arrow points to a large white text box labeled "JSON Data/URL". Below this box is a smaller white text box labeled "JSONPath Expression". To the right of the "JSON Data/URL" box are two dropdown menus: "JSON Template" (set to "2 Space Tab") and "Implementation" (set to "JSONPath 0.8.3"). A white curved arrow points from these dropdowns towards the bottom. At the bottom center is a green button labeled "Process".

JSONiq

The screenshot shows the homepage of the JSONiq website. At the top, there's a browser window with the address bar showing 'www.jsoniq.org'. Below the browser window is a navigation bar with links: 'The JSONiq Language', 'JSONiq Book', 'JSONiq Extension to XQuery', 'Implementations', 'Live Sandbox', and a 'Mailing-List' button. The main header features a large JSON object: `{ "codename" : ["JSONiq"] }`. Below this, the title 'The JSON Query Language' is centered. The page is divided into three columns, each with an icon and a heading. The first column has a 'Hello my name is JSONiq' graphic and the heading 'Decades of Lessons Learnt'. The second column has a gear icon and the heading 'Complex Processing'. The third column has a cloud and database icon and the heading 'The SQL of NoSQL'. Each column contains a paragraph of text describing JSONiq's capabilities and history.

```
{ "codename" : [ "JSONiq" ] }
```

The JSON Query Language

Decades of Lessons Learnt

JSONiq is a query and processing language specifically designed for the popular JSON data model. The main ideas behind JSONiq are based on lessons learnt in more than 30 years of relational query systems and more than 15 years of experience with designing and implementing query languages for semi-structured data.

Complex Processing

A JSONiq program is an expression; the result of the program is the result of the evaluation of the expression. Expressions have fundamental role in the language: every language construct is an expression, and expressions are fully composable. Project, Filter, Join, Group... Like SQL, JSONiq can do all that.

The SQL of NoSQL

JSONiq is an expressive and highly optimizable language to query and update NoSQL stores. It enables developers to leverage the same productive high-level language across a variety of NoSQL products.

JSONiq Example

```
1
2 42 instance of integer # true
3 42 instance of decimal # true
4 42.6 instance of decimal # true
5 42.6e10 instance of double # true
6 "fred" instance of string # true
7 true instance of boolean # true
8 null instance of null # true

JavaScript Object Notation (JSON) Pointer

Abstract

JSON Pointer defines a string syntax for identifying a specific value within a JavaScript Object Notation (JSON) document.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in [Section 2 of RFC 5741](#).

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <http://www.rfc-editor.org/info/rfc6901>.

JSONQuery: Data Querying Beyond JSONPath

Notice: We recommend reading our newer post on [RQL](#).

A new data querying tool for has been added to [Dojo 1.2](#). JSONQuery is a new module intended to succeed and improve upon the JSONPath module introduced in Dojo 1.1. JSONQuery provides a comprehensive set of data querying tools including filtering, recursive search, sorting, mapping, range selection, and flexible expressions with wildcard string comparisons and various operators.

JSONQuery provides [safe evaluation with language agnostic expressions](#) that prevents arbitrary code execution. It also uses intuitive [result-based evaluation](#) that allows successive query operations. Furthermore, the new JSONQuery module provides significant performance improvements, with 20-100x faster execution with the common filter operation on large arrays than the JSONPath module. JSONQuery generally supersedes the functionality of JSONPath and provides syntax that matches and behaves like JavaScript where the syntax intersects for maximum ease of use.

Usage API

A JSONQuery can be executed with the following call:

json:select

The image is a screenshot of a web browser displaying the homepage of jsonselect.org. The browser's address bar shows 'jsonselect.org/#overview'. The page has a dark theme. At the top, the title 'json:select()' is displayed in a large, light-colored font, with the subtitle 'CSS-like selectors for JSON.' below it. To the right of the title, there are navigation links: 'Overview', 'Try It!', 'Docs', 'Code', 'Contact', and 'Credit'. A diagonal banner on the right side of the page says 'Fork me on GitHub'. The main content area on the left contains three paragraphs: 'JSONSelect is an *experimental* selector language for JSON.', 'It makes it easy to access data in complex JSON documents.', and 'It *feels like* CSS.' Below these is the question 'Why not give it a try?'. On the right side, there is a code block showing a JSON selector '.author .drinkPref :first-child' followed by a dashed line and a JSON object. The JSON object has an 'author' field with a 'name' object (containing 'first' and 'last') and a 'drinkPref' array (containing 'whiskey', 'beer', and 'wine'). The 'whiskey' value is highlighted in yellow. The JSON object also has 'thing' and 'license' fields.

JSONSelect is an *experimental* selector language for JSON.

It makes it easy to access data in complex JSON documents.

It *feels like* CSS.

Why not give it a try?

```
.author .drinkPref :first-child
```

```
{
  "author": {
    "name": {
      "first": "Lloyd",
      "last": "Hilael"
    },
    "drinkPref": [
      "whiskey",
      "beer",
      "wine"
    ],
    "thing": "JSONSelect site",
    "license": "(cc) BY-SA"
  }
}
```

Jaql

The screenshot shows the Jaql project page on Google Code. The browser's address bar displays the URL `https://code.google.com/p/jaql/`. The page header includes the Jaql logo (a blue house with a curly brace and 'P' inside) and the text "jaql Query Language for JavaScript(r) Object Notation (JSON)". A search bar is located on the right side of the header. Below the header, there is a navigation bar with links for "Project Home", "Downloads", "Wiki", "Issues", "Source", and "Export to GitHub". The main content area is divided into two columns. The left column contains a sidebar with sections: "Project Information" (including "Project feeds", "Code license" (Apache License 2.0), and "Labels" (json, jaql, query, semi-structured, mapreduce, optimization, parallel)), "Members" (listing vik.erce...@gmail.com, Kevin.Be...@gmail.com, and 9 committers), "Featured" (with a "Downloads" section listing jaql-0.5.1_12_07_2010.tgz and a "Show all »" link), and "Links" (with a "Groups" section listing Jaql Users and Jaql Developers). The right column contains the main project description, which states that Jaql is a query language designed for Javascript Object Notation (JSON), a data format that has become popular because of its simplicity and modeling flexibility. It is primarily used to analyze large-scale semi-structured data. Core features include user extensibility and parallelism. In addition to modeling semi-structured data, JSON simplifies extensibility. Hadoop's Map-Reduce is used for parallelism. Below the description, there is a link to the "JaqlOverview" of the current version and a link to the "RoadMap" of future changes. An "Announcement" section follows, stating that development has been put on hold, but that Jaql is a part of IBM's BigInsights product (updated docs) and that a free download of BigInsights is available where you can try out Jaql (and some new features) along with the many other features in the product. It has been a hectic period for us, but we also want to let you know that we intend to and are working towards reviving Jaql's open source development as well. Please stay tuned and thank you for all of the feedback! At the bottom of the page, there are links for "Terms", "Privacy", and "Project Hosting Help", and a note that the page is "Powered by Google Project Hosting".

Jaql is a query language designed for Javascript Object Notation (JSON), a data format that has become popular because of its simplicity and modeling flexibility. Jaql is primarily used to analyze large-scale semi-structured data. Core features include user extensibility and parallelism. In addition to modeling semi-structured data, JSON simplifies extensibility. Hadoop's Map-Reduce is used for parallelism.

You can get started with the [JaqlOverview](#) of the current version, and check out the [RoadMap](#) of future changes.

Announcement: As you may have noticed, development here has been put on hold. The good news is that Jaql is a part of IBM's [BigInsights](#) product (updated [docs](#)) and we are very excited to help solve a very wide range of problems! A free download of [BigInsights](#) is available where you can try out Jaql (and some new features) along with the many other features in the product. It has been a hectic period for us, but we also want to let you know that we intend to and are working towards reviving Jaql's open source development as well. Please stay tuned and thank you for all of the feedback!

jq

The screenshot shows the homepage of the jq website. At the top, there's a navigation bar with links: jq, Tutorial, Download, Manual, Issues, Source, Try online!, and NEWS. The main content area features a large logo consisting of a dot, a slash, and the letters 'jq'. To the right of the logo, it says 'jq is a lightweight and flexible command-line JSON processor.' Below this, there are two buttons: 'Download jq-1.4-2-g15c4a7f-dirty' and 'Try online!'. Further down, there are three columns of text describing jq's capabilities and ease of use. At the bottom, there's a 'News' section with a bullet point dated '06 June 2014' mentioning the release of jq 1.4.

jq

Tutorial Download Manual Issues Source Try online! NEWS

./jq

jq is a lightweight and flexible command-line JSON processor.

Download jq-1.4-2-g15c4a7f-dirty

Try online!

jq is like **sed** for JSON data – you can use it to slice and filter and map and transform structured data with the same ease that **sed**, **awk**, **grep** and friends let you play with text.

jq is written in portable C, and it has zero runtime dependencies. You can download a single binary, **scp** it to a far away machine, and expect it to work.

jq can mangle the data format that you have into the one that you want with very little effort, and the program to do so is often shorter and simpler than you'd expect.

Go read the [tutorial](#) for more, or the [manual](#) for way more.

News

- 06 June 2014
jq 1.4 (finally) released! Get it on the [download](#) page.

jq play

The screenshot shows the jqplay.org website, a playground for jq 1.4. The interface includes a browser window at the top with the URL <https://jqplay.org>. Below the browser, the page has a dark header with the "jqplay" logo and the text "A playground for jq 1.4".

The main content area is divided into three sections:

- Filter:** A text input field for entering jq filters.
- JSON:** A text area for entering JSON input, with a line number "1" visible on the left.
- Result:** A text area for displaying the output, with a line number "1" visible on the left. Above this area are several checkboxes: "Compact Output", "Null Input", "Raw Input", "Raw Output", and "Slurp".

At the bottom, there is a "Cheatsheet" section with the instruction: "Click on the icons (📄) in the table below to see examples." The table contains the following examples:

<code>.</code>	unchanged input	📄	<code>,</code>	feed input into multiple filters	📄
<code>.foo, .foo.bar, .foo?</code>	value at key	📄	<code> </code>	pipe output of one filter to the next filter	📄

jq Examples

```

JSON Transform

JSON Transform

JSON-T

The screenshot shows a web browser window with the address bar displaying 'goessner.net/articles/jsont/'. The page title is '<stefan.goessner/> Mechanik, das Web und der ganze Rest'. The navigation bar includes links for 'Home', 'Lehre', 'Download', and 'Info'. The main content area is titled '# Transforming JSON' with a date of '2006-01-30' and a version 'e1'. The text describes JSON as a lightweight text format for data interchange, better suited for structured data than XML. It mentions a frequently requested task of transforming JSON data into other formats like XML or HTML. The most obvious way to achieve this is by using a programming language (ECMAScript, Ruby, etc.) and the DOM-API. In XML, documents can be transformed by another XML document containing transformation rules (XSLT) and applying these rules using an XSLT-processor. Adopting that concept, the author has been experimenting with a set of transformation rules (written in JSON). As a result, in analogy to XML/XSLT, the combination JSON/JSONT can be used to transform JSON data into any other format by applying a specific set of rules.

The second section is titled '# Introducing JSONT' with a date of '2006-01-30' and a version 'e2'. It starts with 'Let's start with a simple JSON object' and shows a JSON object:

```
{ "link": { "uri": "http://company.com", "title": "company homepage" } }
```

 which is to be transformed into an HTML link element:

```
<a href="http://company.com">company homepage</a>
```

 For doing this, a corresponding rule is written:

```
{ "link": "<a href=\"{link.uri}\">{link.title}</a>" }
```

 and using a processor like `jsonT(data, rules)` the rule can be applied to the data.

JSON Patch

A screenshot of a web browser displaying the jsonpatch.com website. The browser's address bar shows 'http://jsonpatch.com/'. The website has a clean, minimalist design with a white background and black text. The main heading is 'What is JSONPatch?'. Below it, there is a paragraph explaining that JSON Patch is a format for describing changes to a JSON document, used in combination with the HTTP PATCH method. It also mentions that patch documents are themselves JSON documents and that the format is specified in RFC 6902. The next section is 'Simple example', which contains three sub-sections: 'The original document' showing a JSON object with 'baz' and 'foo' properties, 'The patch' showing an array of three operations (replace, add, remove), and 'The result' showing the final JSON object after the patch is applied. The final section is 'How it works', which explains that a JSON Patch document is a JSON file containing an array of patch operations, and that the operations are applied in order. The website also has a 'JSON Pointer' link at the bottom.

http://jsonpatch.com/

What is JSONPatch?

JSON Patch is a format for describing changes to a [JSON](#) document. It can be used to avoid sending a whole document when only a part has changed. When used in combination with the [HTTP PATCH method](#) it allows partial updates for HTTP APIs in a standards compliant way.

The patch documents are themselves JSON documents.

JSON Patch is specified in [RFC 6902](#) from the IETF.

Simple example

The original document

```
{
  "baz": "qux",
  "foo": "bar"
}
```

The patch

```
[
  { "op": "replace", "path": "/baz", "value": "boo" },
  { "op": "add", "path": "/hello", "value": ["world"] },
  { "op": "remove", "path": "/foo" }
]
```

The result

```
{
  "baz": "boo",
  "hello": ["world"]
}
```

How it works

A JSON Patch document is just a JSON file containing an array of patch operations. The patch operations supported by JSONPatch are "add", "remove", "replace", "move", "copy" and "test". The operations are applied in order; if any of them fail then the whole patch operation should abort.

JSON Pointer

JSON Patch Standard

The screenshot shows a web browser window with the title "RFC 6902 - JavaScript Object Notation (JSON) Patch". The address bar shows the URL "https://tools.ietf.org/html/rfc6902". The page content includes links for [Docs], [txt|pdf], [draft-ietf-appsaw...], [Diff1], and [Diff2]. The status is "PROPOSED STANDARD". The authors listed are P. Bryan, Ed. (Salesforce.com) and M. Nottingham, Ed. (Akamai), dated April 2013. The title "JavaScript Object Notation (JSON) Patch" is centered. The abstract describes the JSON Patch document structure for expressing a sequence of operations to apply to a JSON document. The status of the memo is "This is an Internet Standards Track document." The document is a product of the IETF, representing the consensus of the IETF community, approved for publication by the IESG. Information about the current status, errata, and feedback is available at <http://www.rfc-editor.org/info/rfc6902>. JavaScript Object Notation (JSON) Patch

Abstract

JSON Patch defines a JSON document structure for expressing a sequence of operations to apply to a JavaScript Object Notation (JSON) document; it is suitable for use with the HTTP PATCH method. The "application/json-patch+json" media type is used to identify such patch documents.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in [Section 2 of RFC 5741](#).

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <http://www.rfc-editor.org/info/rfc6902>.
